ABOUT NEXTFLEX
NextFlex is a consortium of American electronics companies, academic institutions, non-profits, state, local and federal government partners with the shared goal of advancing U.S. manufacturing of Flexible Hybrid Electronics (FHE). Since its formation in 2015, the NextFlex community of technologists, educators, problem solvers, and manufacturers have come together to collectively facilitate FHE innovation, narrow the advanced manufacturing workforce gap, and promote sustainable electronics manufacturing ecosystems.

WHAT IS FHE?
Flexible Hybrid Electronics (FHE) as defined by NextFlex is the field that exists at the intersection of printed and additively manufactured electronics with conventional semiconductor devices and discrete components. FHE is broader, though, than is sometimes interpreted from this description, as FHE also includes electronics that can stretch, bend and twist, those which are conformally built onto surfaces in three dimensions, and those which are additively manufactured in three dimensions, regardless of mechanical flexibility. Advanced semiconductor packaging and additive printed circuit board (PCB) manufacturing are areas of growing focus for NextFlex as novel additive techniques provide distinct capabilities on both flexible and rigid substrates.

TECHNICAL WORKING GROUPS
NextFlex Technical Working Groups (TWGs) are a devoted group of subject matter experts who collaborate through NextFlex on establishing FHE manufacturing technology roadmaps to identify key technology gaps and technology planning requirements to advance the manufacturability of flexible hybrid electronics. There are currently eleven TWGs. These include six application areas called “Technology Platform Demonstrators,” and five that are called “Manufacturing Thrust Areas.” Each TWG is led by a small team of “co-leads” from a balance of academia, government, and industry. Including the 35 co-leads, there are 250+ subject matter experts regularly convening to develop, expand, and refine the FHE Technology Roadmaps.

FHE TECHNOLOGY ROADMAPS
The FHE Technology Roadmaps are narrative documents developed by the TWGs in each eleven of the technical areas of emphasis. These roadmaps are a critical asset to NextFlex members and contain significant detailed information on the current state of the art, market opportunities and needs, key stakeholders, a five-year forward-looking development roadmap, and prioritized technical gaps for each TWG.

The following pages present single-page summaries of the full FHE Technology Roadmaps available to NextFlex members.
SCOPE The focus of the Device Integration and Packaging Technical Working Group (DIP-TWG) is to establish manufacturing methods for preparation, placing, interconnecting, and protecting circuit components onto flexible substrates for the fabrication of fully flexible and/or conformal electronic circuits. The DIP-TWG plans integration methods for sensing, communication and computational elements that can adapt to a multitude of geometric and environmental constraints.

KEY OPPORTUNITIES
- Printed passives using inkjet, aerosol-jet and direct-write
- Semiconductor packaging and heterogenous integration
- Fully and semi-additive PCB manufacturing
- Printed structures for RF and mm-wave comms
- Device preparation including thinning and bumping
- Thin die handling and placement
- Double-sided component assembly on flex
- Reliable rigid-to-flex and flex-to-flex interconnect

TECHNICAL ROADMAP TAXONOMIES AND GAP AREAS

PROJECT CALLS
To date, NextFlex has funded 28 projects that align to the Device Integration & Packaging Working Group, including PC4.1 shown below.

PC4.1: Application-Responsive Encapsulation Processes for FHE Devices led by Eastman Chemical Company & Binghamton University.
SCOPE Material properties and functionality are critical drivers for the technological development and performance of flexible hybrid electronic devices. Materials development is driven by the needs of the NextFlex community, but also by cross-fertilization from materials developments outside NextFlex.

KEY OPPORTUNITIES
- Stretchable substrates and inks
- Printed passives components
- Active semiconductor materials
- Interconnect materials and processes
- Improved consistency/reliability of individual inks

TECHNICAL ROADMAP TAXONOMIES AND GAP AREAS

PROJECT CALLS
To date, NextFlex has funded 9 projects that align to the Materials Working Group, including PC6.4 shown below.

PC6.4: ECAs Magnetic-Oriented Anisotropic Conductive Adhesives and Low-Temperature Solder for FHE in Harsh Environments led by Auburn University.
**SCOPE** The objective of the Modeling & Design Technical Working Group is to identify the key gaps in computational methods and tools for flexible hybrid electronics product design and analysis. The technical fields include but are not limited to FHE electrical design, manufacturing process modeling, reliability modeling, multi-physics modeling, and FHE material database integration. Simulation software or computer-aided design tools to support the FHE modeling and design needs are indirectly related to M&D-TWG roadmap.

**STATE OF THE ART**
- Existing process simulation and modeling software for 3D printing such as Additive Works and Simufact can possibly be used for FHE additive-printing processes, although the simulation accuracy and compatibility with various FHE printing processes are yet to be investigated.
- NextFlex has invested in an initial phase of FHE-PDK development which lays the foundation of FHE electrical simulations and device models based on actual FHE device characterizations.

**KEY OPPORTUNITIES**
- Wide adoption of FHE design tools and PDK by NextFlex members
- Statistical analysis for manufacturing process yield and analysis capability to improve the yield
- Predictive modeling for FHE failure modes
- Validated multiphysics models and simulation tools for FHE applications
- Accelerate FHE design process via cloud-based workflows and ML-driven design suggestions

**TECHNICAL ROADMAP TAXONOMIES AND GAP AREAS**

**PROJECT CALLS**
To date, NextFlex has funded 9 projects that align to the Modeling & Design Working Group, including PC6.6.2 shown below.

*PC6.6.2: Design Tool Development for Printing Conformal Circuits led by Integrated Deposition Solutions.*
SCOPE The development of flexible hybrid electronic devices is dependent on material properties, printing processes, and microfluidic components. The materials primarily include functional inks and NextFlex is focused on (a) defining material properties to enable FHE at low- and high-volume manufacturing, (b) expand material database inputs to include “real-world performance” data and (c) developing product design guides which define materials, printing processes, post-processing, and assembly methods.

Printing

- Via printing, High-speed insertion of components
- In-line metrology, precise layer registration
- R2R integration with controlled atmosphere
- Multi-layer structures; Inline insertion of components
- Printers with multiple deposition modes

Direct Writing

- Design-to-Toolpath Generation
- Single / Multi-material printing of devices
- Single material printing at low-volume
- -

Microfluidics

- Hybrid FHE/MF component, Stretchable microfluidics
- Rigid MF elements for FHE
- Rigid MF elements
- Rigid MF systems
- Screen-printed, laminated materials for test-strips

KEY OPPORTUNITIES

- High-volume printing processes capable of high-resolution features (<20 μm)
- Identify equipment with precision layer-to-layer registration capability (<10 μm)
- Roll-to-roll process integration of validated off-line process technologies with controlled atmosphere
- In-line metrology and component attach

TECHNICAL ROADMAP TAXONOMIES AND GAP AREAS

INK & MATERIALS

- Materials & Process Database
- Stretchable conductive inks
- Printed dielectric inks for multilayer printing

MICROFLUIDICS

- Flexible active fluid control
- Integration of MF sub-components
- FHE lab-on-a-chip

DIRECT WRITING

- Addressing scalability
- In-situ process monitoring and feedback loop
- Design rules

PRINTING

- Layer-to-layer registration
- High volume techniques at high resolution
- In-situ processing & Metrology

PROJECT CALLS

To date, NextFlex has funded 21 projects that align to the Printed Components & Microfluidics Working Group, including PC5.1 shown below.

PC5.1: Enhancing the Endurance and Resolution of Inkjet Printing for Prototyping Through High-Volume Manufacturing of FHE’s led by WPI.
SCOPE The NextFlex Standards, Test & Reliability Technical Working Group (STR-TWG) establishes key goals with needs relevant to standards, test methods, guidelines and qualification programs for flexible hybrid printed electronics. The STR-TWG establishes these goals based on needs demonstrated by the other TWGs, thus making the STR-TWG a responsive group. Additionally, the STR-TWG will identify appropriate standards development organizations to address specific gaps.

KEY OPPORTUNITIES

- Developing FHE-specific standards
- Standard for dielectric inks
- Quality and reliability standard
- Validated independent test methods
- Materials database of consistent information and reflective of industry standards
- Validate equipment communication standard

TECHNICAL ROADMAP TAXONOMIES AND GAP AREAS

PROJECT CALL
To date, NextFlex has funded 7 projects that align to the Standards, Test & Reliability Working Group, including PC6.2. shown below.

PC6.2: Reliability Validation and Sustainment of Direct-Write Printed RF Devices led by Lockheed Martin.
SCOPE  Asset Monitoring System (AMS) devices enable monitoring of performance, status, and health of any item of interest for a user. AMS devices can provide functional capabilities such as condition-based maintenance, time critical monitoring, monitoring for compliance actions, anti-counterfeit, cyber security, active feedback for closed loop control to maximize performance, efficiency, life, remaining useful life and environmental status, as well as improvements in manufacturing quality, and throughput.

STATE OF THE ART
- Current AMS devices are predominately fabricated on rigid printed circuit boards and housed in assemblies connected to higher level systems through wired or wireless interfaces.
- Some RFID systems use printed antennas and interconnects, thinned components, flexible batteries, and integrated sensors, depending on type and number of sensors, power budget, and application.
- The COVID-19 pandemic and associated supply chain disruptions have illustrated the importance of critical asset monitoring systems.

KEY OPPORTUNITIES
- Asset Tracking for Logistics Items
- Environmental Monitoring of Products and Foods
- Process Control Monitoring of Factory Equipment
- In-situ Performance Monitoring of Components in Machinery
- Sensing for Closed Loop Control of Equipment
- Structural Health Monitoring of Buildings, Infrastructure, Vehicles, or Aircraft
- Distributed Sensor Networks for Security Status and Agricultural Monitoring
- Health Monitoring and Control for aerospace, underwater and harsh terrestrial environments
- Anti-Tamper or Anti-Counterfeit

TECHNICAL ROADMAP TAXONOMIES AND GAP AREAS

PROJECT CALLS
To date, NextFlex has funded 9 projects that align to the Asset Monitoring Working Group, including PC5.5 shown below.

**PC5.5: Passive UHF-RFID Tag with Encrypted Security Features for Authentication and Tamper Resistance led by Lockheed Martin**
**SCOPE** The scope of the Automotive TWG includes Human Machine Interfacing (HMI), Antennas/Communications, Sensors, In-Mold Electronics (IME), Testing/Standards. Future scope of the automotive TWG may include Shape-Morphing and Adaptive Surfaces. Automotive platforms increasingly use electronics for several function-critical and safety critical functions including touch surfaces, acquisition of signals from sensors and systems, guidance, navigation, control, charging, sensing and operator interaction. The use of FHE and additive technologies creates an opportunity to reduce the weight of the automobile through the use of printed electronics on structural plastic and flexible hybrid electronics.

**KEY OPPORTUNITIES**
- HMI controls on steering wheel, interior / exterior doors
- Integrated heaters in seats, arm rests, interior body panels for comfort
- Lidar / camera heaters for deicing and startup warming
- Integrated startup warmers and health sensors for EV batteries

**TECHNICAL ROADMAP TAXONOMIES AND GAP AREAS**

**PROJECT CALLS**
Launched in late 2021, NextFlex has not yet funded a project that aligns with the Automotive TWG. Several recent projects that align with the Integrated Antenna Arrays TWG have developed enabling FHE technologies that could be adapted for automobiles.
SCOPE The Flexible Power TWG scope covers energy supply for FHE and the integration of power systems with TPDs and FHE products. Power and energy supply are at the core of all FHE product functionality. Capabilities such as wireless communication or information display are power-intensive and combined with use case needs such as continuous sensor data recording or long sleep times, means that the power system can limit a product’s usable lifetime.

STATE OF THE ART
- Capacity/area acceptable given large areas available for most applications
- Peak power/area acceptable for some technologies
- Flexibility (dynamic cycling): insufficient relevant data
- Thickness is a fundamental limit for flexibility and integration in many FHE applications
- Interconnects and integration achieving electrical and mechanical reliability: insufficient data
- Environmental testing: insufficient data
- EH&WC cycle lifetime combined with flex: insufficient data

KEY OPPORTUNITIES
- Mechanical and dimensional constraints
- Peak power requirements
- Energy and power budget
- Integration and interconnect of flexible power

TECHNICAL ROADMAP TAXONOMIES AND GAP AREAS

PROJECT CALLS
To date, NextFlex has funded 1 project that aligns to the Flexible Power Working Group; PC5.6 is shown below.

SCOPE Human monitoring systems (HMS) are emerging technologies that allow for on-demand and often wireless tracking of information of physiological, cognitive, biological, and situational states of humans with the objective of providing new capabilities, such as medical diagnosis and therapy, increased safety, injury prevention and performance augmentation capabilities.

STATE OF THE ART
- Proliferation of tattoo-like bio-electronic devices that exhibit similar mechanical compliance as the human tissue
- Wearable non-invasive / minimally invasive fluid-based biomarker sensing devices, particularly for electrolyte and metabolite monitoring
- Environmentally friendly biodegradable/transient electronics
- Broader acceptance and real-world implementations of flexible wearable and implantable electronics devices
- Advances in scalable and low-cost manufacturing to simultaneously achieve wearable high performance, low footprint, low power consuming devices with strong connectivity

KEY OPPORTUNITIES
- Remote patient monitoring
- Wellness monitoring for diagnosing and treating chronic diseases
- Wearable for worker safety and performance enhancement
- Defense and commercial cognitive state monitoring and augmentation

TECHNICAL ROADMAP TAXONOMIES AND GAP AREAS

PROJECT CALLS
To date, NextFlex has funded 12 projects that align to the Human Monitoring Systems Working Group, including PC4.8 shown below.

PC4.8: Wearable Interstitial Fluid Biomarker Monitoring Device led by GE Research and Binghamton University.
SCOPE
An Integrated Antenna Array (IAA) is defined as the combination of (a) physically reconfigurable flexible antennas, and/or (b) the processing of conformal (non-planar) antennas, (c) through the support of RF compatible materials and the integration of electronics. The IAA working group seeks to demonstrate manufacturing capability rather than develop new antennas. The three types of IAA systems that have been defined to demonstrate the FHE technologies are (a) 2D Flex Hybrid Array Antenna, (b) 2.5D Conformal, High Performance Phased Array with Integrated Electronics, and (c) 3D Integration of 2D/3D Antenna Systems with Embedded Electronics and Sensors.

STATE OF THE ART
- A number of conformal / flexible antenna architectures have been developed and are well documented in the literature. Typical examples are patch antennas and arrays, printed dipoles, wraparound antennas and arrays, substrate integrated waveguide antennas, spirals, and others.
- Recent advances in additive manufacturing technology have enabled new means to produce conformal antennas. Enabling technologies include 2D, 2.5D, and 3D printing.
- Truly flexible antenna systems have been produced using modified inkjet printers to deposit flexible conductive inks on flexible substrates such as Kapton and Corning Willow Glass.

KEY OPPORTUNITIES
- Communication - defense and commercial
- Navigation - defense and commercial
- Intelligence, Surveillance, Reconnaissance (ISR) - defense
- Electronic warfare - defense
- Radar - defense and commercial
- Sensor - defense and commercial
- Automotive – body panel integration

TECHNICAL ROADMAP TAXONOMIES AND GAP AREAS

PROJECT CALLS
To date, NextFlex has funded 15 projects that align to the Integrated Antenna Arrays Working Group, including PC4.9.2 shown below.

**SCOPE** Soft and wearable robotics considers technologies comprised of composites of soft materials that, when integrated as a system, perform at least two of the basic functions of a robotic system at TRL 3/4: 1) “sense,” measure or detect some salient characteristic or aspect of the operating environment; 2) “decide,” make decisions based on that sensed information; and 3) “act,” physically modify its own state or the environment in some manner based on the decision.

**KEY OPPORTUNITIES**

- **Defense**: robots for rescue and recovery and active exosuits for human capacity augmentation.
- **Healthcare**: minimally invasive surgery, remote physical examination, targeted drug delivery, rehabilitation, personal assistance, and prosthetics.
- **Industrial Services & Manufacturing**: maintenance, inspection, repair and overhaul for critical machinery and structures such as power turbines, marine vessels, aircraft engines, industrial pipelines, and subsea oil & gas platforms.
- **Food and E-Commerce**: Automation for e-commerce order fulfilment could be done cost-effectively and productively via a robotic solution that can adapt to a variety of tasks, such as handling packages and food products of a range of irregular shapes and sizes without reconfiguration or retraining.

**TECHNICAL ROADMAP TAXONOMIES AND GAP AREAS**

**PROJECT CALLS**

To date, NextFlex has funded 1 project that aligns to the Soft & Wearable Robotics Working Group; PC3.6 is shown below.

*PC3.6: Flexible Skin Sensing for Soft Robotic Exoskeleton Knee led by Lockheed Martin & Georgia Tech.*
